Introduction:

This document explores customer segmentation and analysis based on a dataset from a shopping mall. The dataset includes customer information, such as age, annual income, and spending score, along with unique identifiers and gender.

Dataset Overview:

CustomerID: A unique identifier for each customer.

Gender: Customer gender (Male or Female).

Age: Customer age.

Annual Income (k\$): Customer annual income in thousands of dollars.

Spending Score (1-100): A score reflecting customer spending behavior and habits.

Purpose

The goal of this analysis is to cluster customers based on their attributes and behavior. By segmenting customers, we aim to gain insights into their preferences and tailor marketing strategies to improve customer satisfaction and optimize business operations.

Problem Statement

You own the mall and want to understand the customers like who can easily converge [Target Customers] so that the sense can be given to the marketing team and plan the strategy accordingly.

1. Import Libraries

```
In [3]: import numpy as np
   import pandas as pd
   import matplotlib.pyplot as plt
   import seaborn as sns
   import scipy.stats as stats
   import pylab
   from sklearn.preprocessing import LabelEncoder, StandardScaler
   #Model
   from sklearn.cluster import KMeans,AgglomerativeClustering,DBSCAN
```

2.Load Dataset

```
In [6]: # Define the file path
mall_customer_path = '/Users/admin/Documents/Mall_Customers.csv'
                 # Read the CSV data into a Pandas DataFrame
mall_customers = pd.read_csv(mall_customer_path)
  In [8]: # Display the first few rows of the DataFrame
print(mall_customers.head())

        CustomerID
        Gender
        Age
        Annual Income (k$)
        Spending Score (1-100)
